Cost per Lease	\$859.09	\$1,025.00	▼ \$165.91 (-16.2%)

Where you are going

Projected trajectory over the next 30-60 days.

Your trajectory is healthy. Occupancy has climbed 1.3 points over the last 30 days and 2.4 points year-over-year, while available units have dropped from 24 to 18 in the same window. If lease velocity holds at 11 per 30 days, you should clear 95% occupancy within the next 30-45 days. The biggest risk is application drop-off: 17 applications converted to 11 leases — watch tour-to-application conversion closely or your forward pipeline will tighten.

How you got here

Causes of the month-over-month and year-over-year changes.

The biggest mover was cost per lease, down 18% month-over-month and 16% year-over-year while service spend stayed flat. That means the media mix is producing more leases per dollar — a sign that the current campaign weighting is working. Occupancy gains followed lower exposure (down 0.8 points MoM) and a higher leases-last-30 count, suggesting demand is outpacing supply rather than driven by price concessions. The cost discipline plus volume lift is what moved you out of the prior-year position.
